(54) MODEL FORECAST CONTROLLER

(S7)Abstract:

PURPOSE: To provide the model forecast controller which can be applied to a control object having a nonlinear characteristic by using sequential quadratic programming to execute the control operation of a nonlinear evaluation function and a nonlinear constraint derived from a nonlinear model.

CONSTITUTION: A manipulated variable (u) inputted to a control object 1 and a controlled variable (y) outputted from the object 1 are observed, and an obtained time series data group is stored in a response data base 2, and a nonlinear model is identified by a nonlinear model identifying means 3. The model is stored in a model data base 4 and is sent to a control response forecast part 5, and a manipulated variable forecast value is estimated based on past manipulated variable and controlled variable obtained from the response data base 2. An optimum manipulated variable operation part 6 obtains an optimum manipulated variable or an optimum manipulated variable increment by nonlinear

programming based on the future target value set by a future target setting part 7 and the control forecast value obtained by part 5. A discriminating part 8 discriminates convergence or not and outputs the optimum manipulated variable at the time of convergence.
